The purpose of CAP is to provide a Digital Asset Management Ecosystem (DAME) with an internal UI and API for interacting with any IR participating in the DAME.

**01 MANAGE SCHEMATA**

CAP supports the automatic ingestion of any RDF schema that is accessible over HTTP.

Once added, a schema can be used to control the metadata that can be added to an IR’s content.

**02 REGISTER IRS**

Any number of Institutional Repositories can be registered with CAP, each one specifying its own supported schemata.

CAP will support interaction with multiple IRSs, including DSpace and Fedora, and potentially more in the future.

**03 CURATE CONTENT**

Once an institutional repository is registered.

and schemata are added to it, CAP’s UI and API allow for full CRUD interaction with that repository’s content.
